An engine is down a bank, and the wreck-master wishes to haul it in the direction of least resistance, or by the way that it can be drawn back to the track with the least labor. The locomotive or wrecking-car engine used to supply the power cannot be put in a position to pull directly upon the wrecked engine, so a snatch block is anchored in the right position, and through it the force to do the hauling is transmitted in the direction required. Why would a strong ring not be as good as the snatch block or the single pulley? asked Palmer. That brings up a question of friction, replied Kinvig. There are two kinds of friction which we are all very familiar with in shop and railroad work. When you roll a pair of wheels on the rails they are easily moved, but if you try to slide them a great deal of strength must be exerted. One is a case of rolling friction, the other is sliding friction. A rope passed over a pulley that revolves, moves by rolling friction; when a rope is moved over a bar or through a ring, it has to be moved by sliding friction. In the latter case the work lost in friction is very great. We all know that a wheel can be rolled much easier than it can be slid, said Palmer, but a flexible thing like a rope sliding...
